L.O. – To create a simple animation using a space background and star images

Log into J2e and then click on jit5. You will see a pink animate button, click on this.

You will need a background and you can create one by choosing from the templates selection. Scroll across to find the space background frame.

Create the first frame by selecting stars from the image gallery. Build up the animation by putting stars in each new frame. Click play to see the animation.

## Task 1

You can make the stars twinkle by changing the size of the star images, by placing them on the same spot in each frame. You should see a faint image on each new frame of the stars from the previous frame. This will help you to make sure you place them in the same spot each time.

Create your own twinkling starry sky by changing the size of the stars each time.

## Task 2

You can create your own background with the paint tools by selecting the blank template and clicking on the first box next to the play button (the background frame).

Create your own background and draw your own stars, using the paint tools.

## Challenge

Can you make a rocket move across the sky?

Can you add in other planets?
