

This week I am going to do some scientific experiments to try and figure out what plants need to grow.

Each pot has the same pea seed in it. Have a look at what I have changed as part of each experiment.

Can you make predictions about what might happen?

Do you think all the seeds will change and grow? Why?

Which pot do you think will have the strongest plant? Why?

Do you think the seed without soil will grow or change? Why?

I will take photographs in 5 days to show you what is happening then you can see if your predictions are coming true.
